

The non-density is real. The reason for it does not transfer.

Blink's attendee app is genuinely calm, and the instinct to want that is backed by our own audit. But their calm is bought with an absence we cannot afford — their rows carry no reason, no risk and no next action. The philosophy transfers. The metric would quietly cost us the product.

SUBJECT	METHOD
blink.global attendee app, marketing frames	Site driven live, frames zoomed and counted
PROPOSAL	VERDICT
Adopt the non-density below the fold	Partly — see the split below

What is actually on their home screen

Reconstructed from the frames — layout and hierarchy theirs, rendering ours. This is the *entire* screen, not a crop.

BLINK — ATTENDEE HOME, WHOLE SCREEN

THE CENSUS

Sections	2
Rows in the whole day	4
Chips in the entire list	1
Counters / badges	0
Progress indicators	0
Unread dots	0
Text tiers per row	2 + time
Icons inside rows	0
Rows carrying a reason	0

Row grammar: bold title, muted subtitle, right-aligned tabular time on the same baseline. Nothing else. The current item is *tinted*, not badged — no "NOW" label, no marker. One chip exists in the entire list, on the one item with a status worth stating.

*The gap board already ruled on three of these: two text tiers per row and earned-not-decorative chips are **already our rules**; tint-the-now is **already on our build queue** — with `--steel-tint`, not their amber. So the row grammar is not the question. The page grammar is.*

Where the idea holds

Our own audit already asked for this

Strongest support

The 17 July Attention & Density Re-Audit: "**The attention ENGINE is full. The attention PRESENTATION is not calm.**" — one ranked list re-expressed across three or four surfaces with two or three counters. "**The fix is subtraction at the presentation layer, not more engine.**"

Blink is a working reference for that subtraction. The instinct is not a whim — it converges with a finding we already made and have not yet acted on.

Below the fold is *not* the arrangement the gap board rejected

Genuinely different proposal

The board rejected *Explore-above-agenda* — engagement before operations — on the grounds that a host has neither spare attention nor spare time.

This proposal is the **inverse**: operations above the fold, calm below. That is not the rejected idea. Arguably it is its correction, and it is coherent with UX_04's zone architecture — the fold becomes a real boundary between *what is being asked of you* and *what is merely true*.

Where it breaks

Whitespace does not fix duplication — it spreads it out

★ The sharpest objection

Our density finding was never "rows are too tight." It was that **the same ranked list appears on three or four surfaces with two or three different counters**. That is a *repetition* problem.

Adding air below the fold does not remove a single duplicate. It makes the duplicates further apart and the page longer — which reads as calm in a screenshot and as *more scrolling to reach the same repeated thing* in the hand. **If we spend this effort on spacing instead of de-duplication, we will have made the page look like Blink and feel exactly as it does now.**

Their calm is bought with an absence we cannot afford

Load-bearing

The board, verbatim: *"No reason, no risk, no next action. The agenda states what and when, never why or what happens if it slips... Blink is a beautiful presentation of state; we are a guide."*

Four rows fit airily because each row is three short strings. Our rows carry a reason attached to a destination — *"Add the event date to time the plan."* A density target imported from a product with no reasons will, applied honestly, delete reasons. **That is the failure mode to name in advance, because it will look like progress while it happens.**

Their user has four things; ours has a roster

Scale mismatch

Blink's frame shows a whole day in four rows because an attendee's day *is* four rows. A host has 15 raise engines, vendors, guests, money and a run of show.

Generous row height is free at $n=4$ and hostile at $n=20$ — below the fold is exactly where a host *scans for a specific thing*, and airiness increases time-to-find. The pattern is sound where the list is short and inverted where it is long.

The verdict

The philosophy transfers. The metric does not. Do not target "fewer elements below the fold." Target **"each fact appears exactly once."** Blink's calm is a *consequence* of having one list; it is not a spacing decision, and copying the spacing without the single-list discipline buys the appearance and none of the effect.

Put differently: Blink can be calm because it has no obligations. We can only be calm by removing **repetition** — never by removing **information**.

What the fold could actually mean

If the fold is promoted to a real boundary, it should divide by *obligation*, not by importance — which gives a testable rule rather than a taste.

ZONE	HOLDS	DENSITY	RULE
Above the fold	The one ask, with its reason and its route	Tight	Exactly one loud thing. Unchanged from today's doctrine.
Below the fold	State that is <i>true</i> but is not <i>asking</i> — settled picks, the roster, what is already handled	Airy — Blink's grammar	Nothing below the fold may carry a counter, a badge, or a colour that appears above it. If it needs attention, it belongs above.

A proposed contract for the boundary. Every row is checkable in code.

Both frames have identical spacing. The right one is airy and still not calm — four surfaces re-expressing one ranked list, three counters disagreeing, two colours competing below a fold that promised quiet. **That is the outcome to avoid, and spacing alone cannot avoid it.**

How to test it before building

1. **Count first.** On the live host home, count how many distinct surfaces express the same ranked list, and how many counters disagree. The 17 July audit says three or four and two or three — *confirm that against the current build* before designing around it.
2. **De-duplicate, then measure calm.** Remove the repetition and re-screenshot. If it already reads calmer with no spacing change, the density work is done and the fold proposal is unnecessary.
3. **Only then** apply Blink's page grammar — two sections maximum, no counter or badge below the fold, tint-the-now with `--steel-tint`.
4. **Gate it.** A test asserting no `--warn` or `--crit` token and no numeric badge renders below the fold turns this from taste into a rule that cannot rot.

I have not audited hostv2's current below-fold composition in this pass, so every claim here about our own surface is carried from the 17 July re-audit rather than freshly verified. Step 1 exists because of that gap, not as ceremony.

Source: blink.global platform page, driven live and zoomed 1 August 2026. Frames are reconstructions — layout and hierarchy theirs, rendering ours. Marketing material, not the shipped app; no trial, no hands-on.

Our-side claims come from the 2026-07-17 Attention & Density Re-Audit and the Mobbin gap board's Blink section, both in `demo/docs/audits/`. Rendered in Studio Matte, single-theme by decision.
